## WHAT IS SHARKSAFE BARRIER™

The SharkSafe Barrier™ has been developed to ensure the safety of beachgoers from shark related incidents. Our product prevents the loss of tourism in areas visited by sharks and stop the environmental damage caused by shark cull policies.

**PERMANENT INSTALLATION - NO NEED TO REMOVE DURING WINTER WEATHER CONDITIONS**

The eco-friendly SharkSafe Barrier technology, developed by marine biologists at Stellenbosch University (SU) and their collaborators, has for example been installed at a private island in the Bahamas. The SharkSafe Barrier combines biomimicry of a kelp forest and magnetic fields to keep humans and sharks apart from each other without harming the sharks or large marine species and creating reef environments.

A **foundation design** based on nature, as the limpet, our foundation is designed with its radiused angularity; to resist tidal flow or wave action turning it over, we have adopted this for the concrete limpet shaped blocks which hold our barriers in position. *Note the large sea snail taking up residency on this new barrier installation.*

**Safety** – Glow-in-the-dark barrier demarcation technology (example shown)
